

While the provided sources do not explicitly use the name "80% Rule," they describe a highly reliable trading strategy that operates on this exact principle for trading value areas. The rule states that **if the price opens outside the previous session's value area and then re-enters it, it will travel all the way across to the opposite extreme "the vast majority of the time" 1.**

Here is how you execute this setup in practice:

- **Identify the Value Area:** Use the volume profile from yesterday's Regular Trading Hours (RTH) session to establish your value area for the current session 1.
- **Wait for the Signal:** Watch where the price opens. If it opens outside (for example, below) the value area and then pushes back inside, this triggers your entry signal 1.
- **Confirm "Acceptance":** This is a critical detail. The price must show true acceptance inside the value area, meaning **you need to see actual candles closing inside the zone** 2. If the price simply ticks into the area with a wick and immediately rejects, the rule does not apply 2.
- **Set Your Target:** Once the price pushes inside and confirms acceptance, your profit target is the opposite extreme of yesterday's value area 1.
